

Turnkey VDI solution from the Cloud

from Exoscale + oneclick™

EXOSCALE Exoscale started in the beautiful Swiss mountains. In recent years the supplier has grown by leaps and bounds. Today, Exoscale is part of the A1 Telekom Austria Group and with its data centres in Switzerland, Austria, Germany and Bulgaria provides an infrastructure to support European teams in creating native cloud applications. A high degree of automation, unlimited bandwidths, extensive certifications and a high level of service availability characterize Exoscale.

About the oneclick™ Platform

oneclick™ is a Platform-as-a-Service (PaaS) for the provisioning of digital workspaces. Via an interface, oneclick™ is connected to the Exoscale Cloud and includes comprehensive automation tools as well as a management, delivery and security layer for the deployment of turnkey VDI environments.

oneclick™ eliminates on end devices both the cumbersome installation of software and the setup of (VPN) connections to server locations. Encrypted streaming of remote desktops, applications and data into the web browser provides a secure and centralised working environment for the office, home office or on the road.

Quick Facts:

- Ready-to-use remote desktop from the Exoscale Cloud
- No in-depth specialist knowledge required (managing without scripts)
- Easy to understand step-by-step instructions
- Simple composition of the remote desktop as desired

oneclick™ takes care of:

- the technical setup in the Exoscale Cloud.
- the secure and fully automated provisioning of the VDI solution for convenient use via any current web browser on all end devices.

Read out existing Exoscale Cloud environments.

Create and manage new VMs in the Exoscale Cloud.

Assign complete desktops or individual applications to users.

Users can access their personal applications and data from any end device via a secure web porta.

Simplified deployment, imaging and scaling

With oneclick™ you can read out existing environments from the Exoscale Cloud, and – without specialist knowledge – create networks and set up and manage new remote desktops with the required specifications and operating system. You can use pre-configured or self-made images. Depending on the workload, the sizes of the VMs can be adjusted during live operation. Necessary firewall rules can be set directly in oneclick™ and easily administered.

Additional certified security

The oneclick™ platform acts as an additional tested and certified security layer with a Zero Trust Network architecture, whereby the Security Operations Center (SOC) is operated by recognised cyber security experts. Entire workspaces or individual applications can be secured with a 2nd factor.

Added values of the VDI solution from Exoscale + oneclick™

Optimise costs

Using event profiles, cloud resources from Exoscale Cloud can be switched on and off automatically. This allows you to adapt the operation of the utilised VMs to the actual working hours of your users and optimise infrastructure costs. From the Pay-as-You-Go pricing model of Exoscale Cloud, offers can be created at fixed prices.

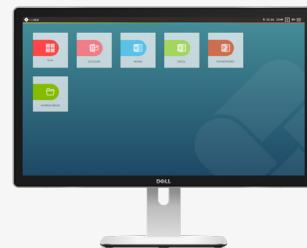

Implement hybrid models

With oneclick™ it is also possible to implement hybrid workplace concepts, where the workload of certain applications is operated in the Exoscale Cloud, while other applications and data are hosted locally in the company's own data centre to meet special compliance requirements.

Real Bring-Your-Own-Device (BYOD)

oneclick™ enables the provision of flexible, individually equipable workspaces that can be added and removed in real time. Access is possible with any HTML5-capable end device, regardless of the operating system and whether it is a workstation, laptop, tablet, smartphone, thin or zero client. No plug-ins need to be installed and maintained.

Everything in one platform

Since the oneclick™ platform combines all components for application provisioning in one Cloud service, all you need is a web browser to access the web portal and you can get started right away. Infrastructure, desktops, applications, data, users and authorisations are managed at a central location.

Multi-client capable

Managed service providers and systems integrator partners can create any number of customer accounts under their master account with just a few clicks. Multi-level distribution models can also be mapped via oneclick™.

Support with the installation

On request, our technical specialists can help with the setup and operation of the environment in the Exoscale Cloud and the migration of previously self-hosted applications and data.

We are happy to help you!
